BUSINESS

DIA WITH PALO ALTO NETWORKS NEXT-GENERATION FIREWALL

Unleash your digital potential with your own ring-fenced high-speed internet connection – safe in the knowledge that your security is in great hands.

What do business on their digital transformation journey need? What they need is their own cost-effective, ring-fenced, high-bandwidth, dedicated connectivity. They need an affordable digital platform that gives them space to grow into the future. And they need peace of mind, in the form of robust security and compliance that scales in line with their aspirations and their business growth.

What is Dedicated Internet Access (DIA)?

Ambitious businesses need more than just an Internet Service Provider. They need an agile partner that offers unconstrained connectivity geared to scale efficiently with business demand.

DIA from Virgin Media Business offers reliable, fast and instant access to data on the move, enabling businesses to operate efficiently and effectively – almost all of the time. Helping to drive digital transformation, and outsmart tomorrow.

With DIA, your business has symmetrical upload and download speeds of up to 1Gbps, which means you can offer a reliable and superior user experience. So, if you're still worrying about bandwidth-intensive applications such as SAP, Oracle, VoIP and video conferencing compromising performance, or if you continually need to upgrade your access requirements – well, those days are over. We have you covered. You'll be able to run these and other multiple services such as mobile, UCC, WiFi Cloud Connect and SIP, while maintaining performance.

What you get

Dedicated: The speed you pay for is the speed you get – just you and your business, nobody else. That means no more sluggish connections at peak times.

Symmetrical: Uploading is as fast as downloading. If five people are all videoconferencing in separate rooms, the rest of your team can share enormous files while your backup does its thing, without a hitch.

Trackable Performance: Our online reporting tool means you can always see what's happening with your service, to help support your business's growth.

Cost effective: It's easy to flex when demand changes and easy to budget when you know the fixed costs upfront. You'll only ever pay for the bandwidth you need.

24/7 monitoring and managing: We take care of the installation and monitor your service day and night, so you can concentrate on the important things – like innovating and growing your business.

Service availability up to 99.85%: This protects your service and our SLAs provide compensation in the unlikely event of an interruption.

What is a managed firewall?

A managed firewall gives your users access to the applications they need while preventing cybersecurity threats.

The Palo Alto Networks next-generation security platform inspects all traffic – including applications, threats and content – and ties it to the user, regardless of location or device type. This platform enables you to:

- Develop a tailor-made security policy

- Reduce response times to incidents

- Discover unknown threats

- Block known vulnerability exploits, viruses, spyware, botnets and unknown malware (APTs)

- Streamline security network deployment

- Secure public and private cloud computing environments

Palo Alto Networks managed firewall

Built on market-leading Palo Alto Networks technology and comes with:

- A fully managed firewall service - 24/7 support of a dedicated team of security experts to take care of everything from installations and policy changes to licence renewals and fault resolution

- Threat management – to protect against known vulnerabilities and exploits that could be used to attack and steal private information or cause denial of service

- WildFire – A cloud-based threat-assessment environment that allows the detection of never-before-seen malware (viruses)

Managed product	DIA Lite + managed firewall	DIA + managed firewall
Install	Free on a 3-year term[2]	Free on a 3-year term[2]
